

Operational Resilience Intelligence Platform (ORIP)

AI-Powered Operational Resilience Workspaces

Vision

The Operational Resilience function has made significant investments in enterprise resilience platforms, crisis management solutions, notification systems, enterprise data integrations, and AI-enabled knowledge capabilities. These platforms already serve as systems of record and provide governance, workflow management, and operational data.

However, many day-to-day Operational Resilience activities remain highly manual and analyst-driven. Activities such as annual reviews, document preparation, stakeholder collaboration, evidence collection, impact analysis, and executive reporting are still performed across multiple disconnected tools including PDF documents, Microsoft Word, email, shared document repositories, spreadsheets, and presentation software.

The objective of this initiative is **not** to replace existing Operational Resilience platforms. Instead, it is to introduce an AI-powered Intelligence and Collaboration Layer that enables analysts to perform their work more efficiently while allowing existing enterprise platforms to continue acting as the authoritative systems of record.

Current State

Today, a typical Business Continuity Plan (BCP) review involves activities such as:

- Downloading the latest Business Continuity Plan from the enterprise resilience platform.
- Converting the generated PDF into an editable document.
- Performing manual reviews and updates.
- Exchanging multiple versions with Business, Technology, Risk and other stakeholders through email.
- Incorporating stakeholder feedback manually.
- Comparing information across multiple enterprise systems.
- Re-entering approved changes into the enterprise resilience platform.
- Triggering the existing approval workflow.

Although operational data is refreshed from enterprise source systems through scheduled integration pipelines, analysts spend a significant amount of time managing documents, emails, and manual comparisons rather than focusing on resilience decision-making.

Proposed Vision

Introduce an AI-powered Operational Resilience Intelligence Platform that acts as the primary analyst workspace while allowing existing enterprise platforms to remain the authoritative Systems of Record.

The platform would provide dedicated AI Review Workspaces for major Operational Resilience processes.

Initial workspaces may include:

- Annual Business Impact Analysis Review
- Business Continuity Plan Review
- Recovery Plan Review
- Crisis Management
- Regulatory and Client Response
- Application Intake
- Business Service Resilience Assessments

Each workspace would combine enterprise data, AI reasoning, collaboration, and decision support into a single user experience.

Business Continuity Review Workspace

The first proposed capability is an AI-assisted Business Continuity Review Workspace.

Rather than managing reviews through PDF files, editable documents, and email chains, analysts would work within a collaborative workspace that provides:

- Live comparison with current enterprise data
- AI-generated recommendations
- Operational drift detection
- Stakeholder collaboration
- Impact analysis
- Review tracking
- Executive summaries
- One-click preparation of proposed changes for submission back into the enterprise resilience platform

The existing enterprise platform continues to own approvals, governance, versioning, and publication.

AI Opportunities

Rather than using AI only for document generation or conversational Q&A, the proposed solution introduces Agentic AI capabilities that actively assist analysts throughout the review lifecycle.

Enterprise Drift Detection

Continuously monitor enterprise systems and identify changes that may impact active reviews.

Examples include:

- New applications
 - Recovery owner changes
 - Vendor changes
 - Location updates
 - Exercise completion
 - Dependency changes
-

Impact Analysis

When a change is detected, AI determines downstream impacts across:

- Business Services
- Functional Areas
- Applications
- Vendors
- Recovery Plans
- Crisis Response Plans
- Regulatory obligations

Instead of simply highlighting changes, AI explains why they matter and recommends actions.

Intelligent Review Assistance

AI can automatically generate:

- Review summaries
 - Analyst questionnaires
 - Suggested document updates
 - Missing evidence
 - Executive summaries
 - Action lists
-

Collaboration Intelligence

Rather than manually reviewing long email chains, AI can:

- Group similar comments
- Detect conflicting feedback
- Prioritize unresolved actions
- Summarize discussions
- Recommend next steps

Future AI Agents

Potential AI agents include:

- Enterprise Data Agent
- Drift Detection Agent
- Dependency Analysis Agent
- Business Impact Analysis Agent
- Business Continuity Review Agent
- Crisis Management Agent
- Regulatory Response Agent
- Executive Reporting Agent
- Scenario Simulation Agent

Each agent performs a focused business capability while remaining under analyst supervision.

Business Benefits

The proposed approach aims to deliver measurable business value by:

- Reducing manual document preparation.
 - Minimizing repetitive comparison activities.
 - Improving consistency across Operational Resilience artifacts.
 - Increasing analyst productivity.
 - Improving audit readiness.
 - Supporting regulatory expectations through stronger evidence collection.
 - Providing earlier visibility of operational changes.
 - Allowing analysts to focus on resilience decisions instead of administrative work.
-

Strategic Positioning

This proposal is designed to complement—not replace—the existing Operational Resilience ecosystem.

Existing enterprise platforms continue to provide:

- Governance
- Workflow
- Systems of Record
- Regulatory evidence
- Approvals
- Master data

The AI platform provides:

- Intelligence

- Reasoning
 - Collaboration
 - Analyst productivity
 - Decision support
 - Executive insights
-

Long-Term Vision

The long-term vision is to evolve from static resilience documents into AI-assisted Operational Resilience Workspaces.

Instead of managing disconnected documents, analysts will work within intelligent review sessions where AI continuously monitors enterprise changes, provides contextual recommendations, assists collaboration, and prepares high-quality updates for approval through existing governance processes.

This approach aligns with the industry's evolution from document-centric resilience management toward service-centric, data-driven, and AI-assisted Operational Resilience while preserving existing investments in enterprise resilience platforms.

Guiding Principles

- Existing enterprise platforms remain the authoritative Systems of Record.
- AI supports analysts—it does not replace business ownership or governance.
- Humans remain responsible for review, approval, and decision-making.
- Existing approval workflows remain unchanged.
- AI focuses on reducing manual effort, improving decision quality, and accelerating Operational Resilience processes rather than replacing established controls.
